It is the most successful system to control Mosquitoes in large areas with the help of control release of CO2 and our Lure.

It is the perfect way to eliminate mosquitoes in larger areas.

MOSK-EAT-0™
Loop

SAFE & ECOLOGICAL APPROACH

Female mosquitoes seeking blood to feed the eggs in their abdomen, detect the presence of CO2 molecules in the air, acids released by the skin and the breathing of their prey.

Releasing CO2 and a copy of these acids, each of the *Loop* Trap-Module is connected to a common Control Center, and will create a "corridor" in which it will retain and catch mosquitoes attempting to move towards the protected area. The pace and intensity of CO2 diffusion, monitored by a Programming and Control Unit, is personalized to the protected zone's actual need. This insures the best user protection, maximizes mosquito elimination and limits CO2 consumption.

FULL SERVICE COMFORT

This unit, which communicates with a remote control station, guarantees a proper operation, without interruption, during the whole season.

Loop is exclusively distributed with a service contract on a project basis with a quotation made after a technical visit of the property, by a technician, to produce a feasibility study and establish the protection's architecture.
